

Healthcare Use Cases — Written Assignment

Name: Md Ejaz Mallick Date: 27/04/26

Q1. Pick one use case from today's session and explain it in your own words. (4 marks)

Use Case : Revenue Cycle & Finance

A1: One use case I found interesting is GST reconciliation in healthcare. Previously, employees had to manually handle around 200,000 transactions every month. This included collecting of data, cleaning it, and then uploading it to government portals, and preparing reports. This whole process used to take almost a month and was quite repetitive, which also increased the chances of mistakes. After automation, a bot now handles all these tasks and finishes it in few minutes. Because of this, the hospital saved about 379 hours every month, reduces processing time by 98.6%, and achieves 100% accuracy.

Q2. Why does a hospital need to submit Form C within 24 hours, and what happens if it doesn't? (3 marks).

A2: Hospitals need to submit form C within 24 hours to follow government rules for tracking foreign patients. This helps in monitoring and helps in maintain proper records for safety purpose. If they fail to submit it within 24 hours , they face penalties , legal issues , or strict action from authorities.

Q3. Max Healthcare had 29 portal logins to manage daily. Why is that a problem, and how did automation fix it? (3 marks)

A3: Max Healthcare had to manage 29 different portal logins every day, which is a very slow process, confusing, and difficult to handle. Employees had to remember multiple usernames and passwords and switch between systems, also they need to manually enter all usernames and passwords increasing the chances of errors and delays. With automation, a bot now handles all logins and tasks from one place. This made the process faster, reduced mistakes, and saved a lot of time and manual effort for the staff.

Q4. If you were an AI Engineer at RPA Tech assigned to a new hospital client, which of the four pillars of healthcare automation would you recommend they start with, and why? (5 marks)

The four pillars are: Claims & Reimbursement, Patient Data & Compliance, Revenue Cycle & Finance, HR & Workforce.

A4: I would recommend with **Patient Data and Compliance**.

If I were an AI Engineer at RPA Tech, I would start with Patient Data & Compliance. Hospitals deal with sensitive patient information and have to follow strict rules like Form C submission and data leakage. Even small mistakes here can lead to serious legal problems. By automating these tasks, hospitals can maintain better accuracy, submit reports on time, and manage records properly. It also creates a strong base, making it easier to automate other areas like finance or HR later. This method will also help in improving overall efficiency and reducing dependency on manual processes in the long run.
